Boundary & Edge Case – Maximum Drug Count & Offline Pharmacy Sync
Prescription Management
P2
Integration
Doctor logged in; patient has identifiers UHID 345678, PRN 98765, ERN 55533; pharmacy service endpoint is simulated as down (HTTP 503). A pending prescription PRX-003 with exactly 20 distinct drugs is generated.
1. Login to HMS as the doctor.
2. Navigate to 'Prescription' – 'Pending' and open patient record using any identifier (UHID, PRN, or ERN).
3. Select prescription PRX-003 and verify that all 20 drug rows are displayed without UI truncation.
4. Click 'Approve' and observe the system response.
5. Verify that a non-blocking warning appears: 'Pharmacy service unavailable – prescription queued for retry'.
6. Check the 'Outbound Queue' tab; confirm that PRX-003 is listed with status 'Pending Sync'.
7. Restore pharmacy service (simulate HTTP 200 response).
8. Trigger the 'Retry Sync' action and verify that PRX-003 is transferred to the pharmacy dispensing queue with status 'Ready for Dispense'.
All 20 drugs are visible and selectable; approval succeeds locally; system queues the prescription when pharmacy is offline; upon service restoration, the retry mechanism pushes the prescription to the pharmacy queue; audit entries reflect both events.
